

NOTE 1: This schematic will be identical for both the "master" and "slave" chips; For testing UART, the "master/sending" PIC will have pin 11 (RC0) tied high, whereas the "slave/receiving" PIC will have pin 11 tied to ground. This simple differentiation allows the function of both PICs to be tested without any software changes necessary.

NOTE 2: D3 was tested with a 1N4148 general purpose (GP) diode. Any equivelant GP diode should be sufficient.

NOTE 3: Datasheet rates $V_{OL_{MAX}}$=0.7V and $I_{OL/IOH}$=±20mA$_{MAX}$
Assuming the LED drops 2V, VR_{LED}=2.3V.
R_{LED} = 2.3V/20mA$_{MAX}$ = 115Ω$_{MIN}$
I_{LED} = 2.3V/240Ω = 9.583mA ∴ 50% of I_{MAX}
